Amendments to the Claims:

This listing of claims replaces all prior versions and listings of claims in the application:

Listing of Claims:

1. (Currently Amended) A microscope, comprising:

a base.

a support arm attached to and extending upwardly from the base, the support arm including a secondary stage height adjuster;

a head attached to the support arm, the head including at least a first distal objective lens and a second distal objective lens, only one of which is in communication with an eyepiece at a given time;

an eyepiece attached to the head and in optical communication with one of the distal objective lens at a given time;

a stage releasably attached to the support arm between the head and the base, where:

the stage is releasably attachable to the support arm at a plurality of locations between the head and the base providing a plurality-wide range of working distances between a lower surface of the head and an upper surface of [[the]] a specimen being viewed with the microscopestage and can be attached in a first position such that when the first distal objective lens is in optical communication with the eyepiece, microscopic viewing is provided with magnification exceeding 45x and a working distance of 10 millimeters or less and can be attached in a second position such that when the second distal objective lens is in optical communication with the eyepiece, macroscopic viewing is provided with magnification less than 45x and a working distance exceeding 10 millimeters, and

when the stage is attached to the support arm at a location, a working distance between the lower surface of the head and the upper surface of the <u>specimenstage</u> is further adjustable to an either greater or lesser working distance using the secondary stage height

adjuster; and

an illuminator positioned between the base and the stage.

(Withdrawn) The microscope of claim 1, wherein:

the head includes a first distal objective lens and a second distal objective lens, only one of which is in optical communication with the eyepiece at a given time; and

the stage can be releasably attached to the support arm in a first position such that when the first distal objective lens is in optical communication with the eyepiece, microscopic viewing is provided with magnification exceeding 45x and a working distance of 10 millimeters or less, and the stage can be releasably attached to the support arm in a second position such that when the second distal objective lens is in optical communication with the eyepiece, macroscopic viewing is provided with magnification less than 45x and a working distance exceeding 10 millimeters.

- (Withdrawn) The microscope of claim 1, further comprising: at least three legs attached to the base.
- 4. (Withdrawn) The microscope of claim 3, wherein the at least three legs are pivotable between at least an open position, wherein the legs support the microscope in a substantially vertical position and a closed position.
- 5. (Withdrawn) The microscope of claim 3, wherein each of the at least three legs include a foot pivotable about a point at which a foot attaches to a respective leg.
- (Withdrawn) The microscope of claim 1, wherein the illuminator is battery-powered, the microscope further comprising:
 - a battery electrically connected to the illuminator.
- (Withdrawn) The microscope of claim 1, wherein the illuminator comprises at least one LED.
- 8. (Currently Amended) The microscope of claim 1, wherein the secondary stage height

adjuster includes a rack and pinion mechanism for further adjusting the upper surface of the specimenstage to either a greater or lesser working distance when the stage is attached to the support arm at a location.

- 9. (Withdrawn) The microscope of claim 1, wherein the support arm includes a handle.
- 10. (Withdrawn) The microscope of claim 1, wherein the stage comprises a substantially transparent container including an interior region configured to contain a specimen.
- 11. (Withdrawn) The microscope of claim 1, wherein the stage comprises a frame and a container releasably attached to the frame.
- 12. (Withdrawn) A microscope, comprising:
 - a base,
 - a support arm attached to and extending upwardly from the base;
 - a head attached to the support arm;
 - an eveniece attached to an upper portion of the head:
 - at least two distal objective lenses attached to a lower portion of the head;
- a lens changer positioned within the head and between the eyepiece and the distal objective lenses, the lens changer:
 - rotatable about an axis that is substantially perpendicular to an optical path, including a plurality of lenses arranged radially about the axis.
- rotatable between a plurality of positions, such that in a position one or more lenses of the plurality of lenses is in an optical path extending from the eyepiece to an upper surface of a stage and including one of the distal objective lenses;
- a stage attached to the support arm between the head and the base and positionable to provide a plurality of working distances between a distal objective lenses and an upper surface of the stage, wherein the stage can be positioned in a first position such that when a first distal objective lens is in an optical path with the eyepiece, microscopic viewing is provided with magnification exceeding 45x and with a working distance of 10 millimeters or less, and wherein the stage can be positioned in a second position such that when a second distal objective lens is

in an optical path with the eyepiece, macroscopic viewing is provided with magnification less than 45x and with a working distance exceeding 10 millimeters; and

an illuminator positioned between the base and the stage.

13. (Withdrawn) The microscope of claim 12, wherein microscopic viewing is provided at a plurality of magnification levels between approximately 50x and 200x with an approximate working distance of 5 millimeters.

- 14. (Withdrawn) The microscope of claim 12, wherein macroscopic viewing is provided at a plurality of magnification levels between approximately 5x and 40x with approximate working distances between 70 and 80 millimeters.
- 15. (Withdrawn) The microscope of claim 12, wherein:

the support arm includes a secondary stage height adjuster, and

the stage is releasably attachable to the support arm at a plurality of locations between the head and the base providing a plurality of working distances between a distal objective lens and an upper surface of the stage, and when attached to the support arm at a location, a working distance between a distal objective lens and the upper surface of the stage is further adjustable using the secondary stage height adjuster to an either greater or lesser working distance.

- (Withdrawn) The microscope of claim 12, further comprising: at least three legs attached to the base.
- 17. (Withdrawn) The microscope of claim 16, wherein the at least three legs are pivotable between at least an open position, wherein the legs support the microscope in a substantially vertical position and a closed position.
- 18. (Withdrawn) The microscope of claim 12, wherein the illuminator is battery-powered, the microscope further comprising:
 - a battery electrically connected to the illuminator.
- 19. (Withdrawn) The microscope of claim 12, wherein the illuminator comprises at least one

Serial No.: 10/815,967 Filed: March 31, 2004

LED.

20. (Withdrawn) The microscope of claim 12, further comprising a rack-adjustment mechanism for further adjusting the upper surface of the stage to either a greater or lesser working distance when the stage is attached to the support arm at a location.

- 21. (Withdrawn) The microscope of claim 12, wherein the support arm includes a handle.
- (Withdrawn) The microscope of claim 12, wherein the stage comprises a substantially transparent container including an interior region configured to contain a specimen.
- 23. (Withdrawn) The microscope of claim 12, wherein the stage comprises a frame and a container releasably attached to the frame.
- 24. (Previously Presented) The microscope of claim 1, wherein microscopic viewing is provided at a plurality of magnification levels between approximately 50x and 200x with an approximate working distance of 5 millimeters.
- 25. (Previously Presented) The microscope of claim 1, wherein macroscopic viewing is provided at a plurality of magnification levels between approximately 5x and 40x with approximate working distances between 70 and 80 millimeters.
